

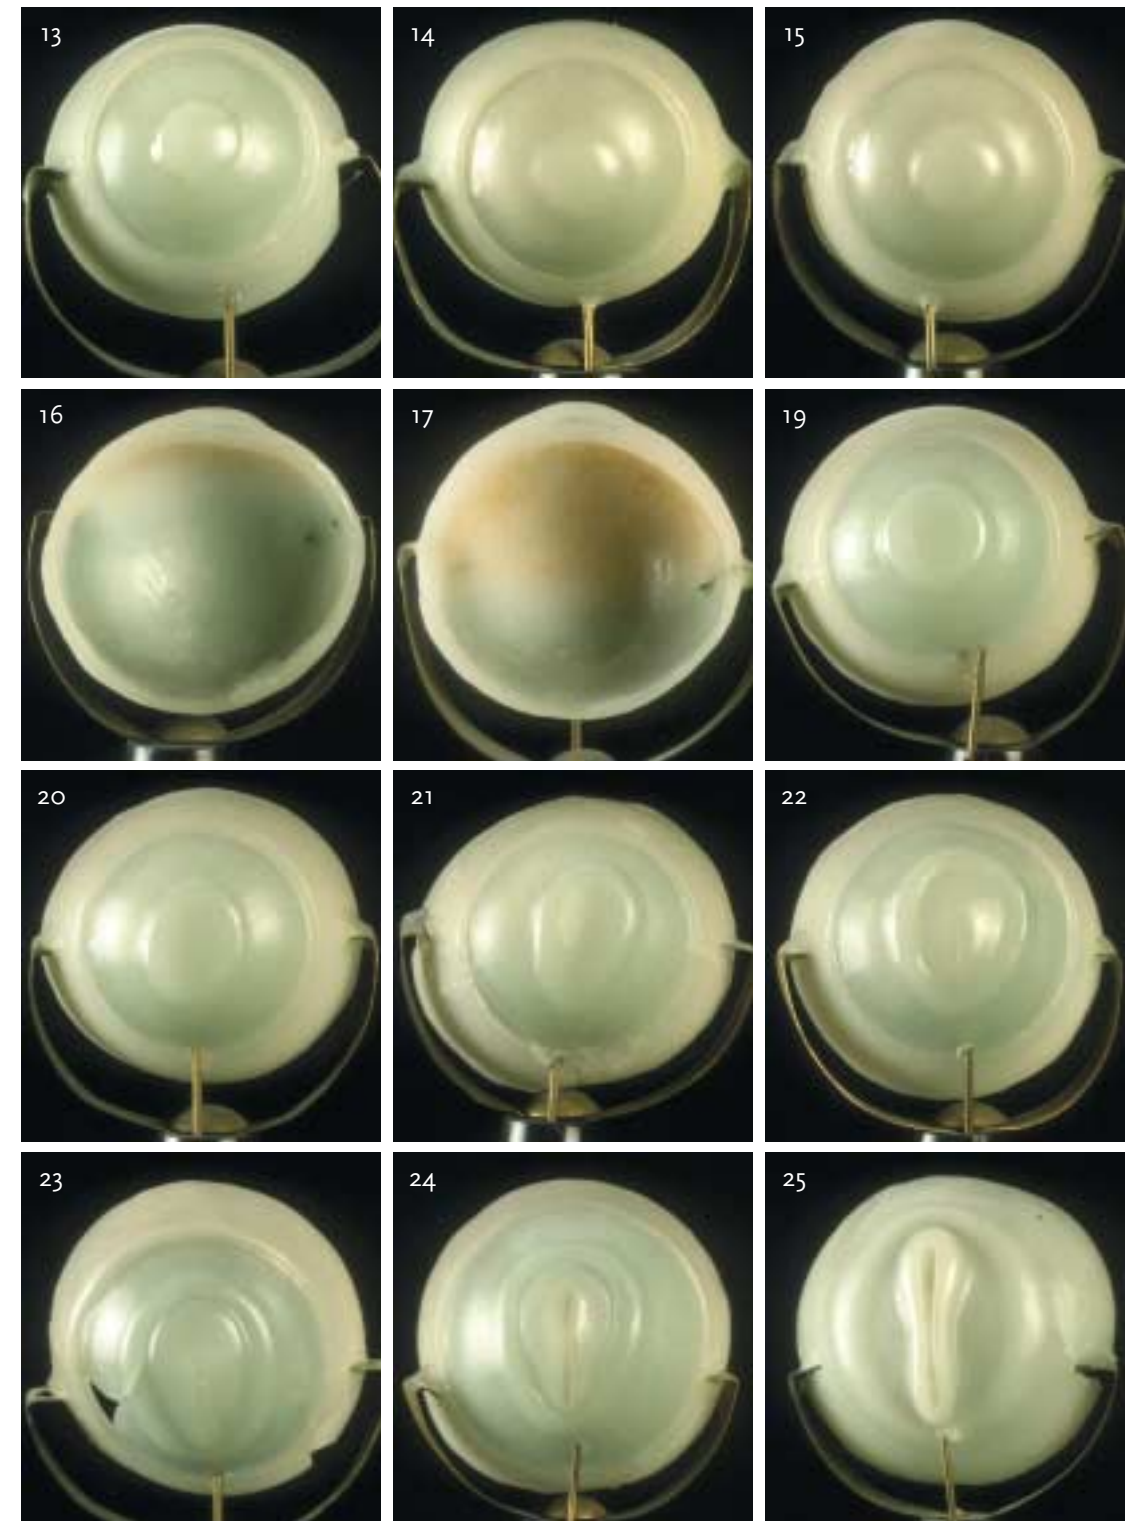

**Plate 4.** The early development of mammals (dog and rabbit) after Theodor Bischoff, which Adolf Ziegler first made during the 1850s. “Because of the great delicacy and colourlessness of the forms to be represented, and the opacity of [the wax], on the one hand, and from the intention through colour differences to make certain parts more distinguishable for teaching, on the other, the present series gained a more schematic character” (Wissenschaftliche

Wachspraeparate von Adolph Ziegler, 11 June 1868, Generallandesarchiv Karlsruhe: 56/1559). Though pictured at the same size here, Ziegler had the embryos grow: the wax part of model 1 is 2.0 cm, and of model 25, 4.8 cm high. Model 18 is missing. Anatomisches Museum Basel.
